**SUBSTITUTED BENZOPYRAN DERIVATIVES
FOR THE TREATMENT OF INFLAMMATION**

FIELD OF THE INVENTION

This invention is in the field of anti-inflammatory pharmaceutical agents and specifically relates to compounds, compositions and methods for treating cyclooxygenase-2 mediated disorders, such as inflammation and inflammation-related disorders.

BACKGROUND OF THE INVENTION

15 Prostaglandins play a major role in the inflammation process and the inhibition of prostaglandin production, especially production of PGG₂, PGH₂ and PGE₂, has been a common target of antiinflammatory drug discovery. However, common non-steroidal antiinflammatory drugs (NSAIDs) that are
20 active in reducing the prostaglandin-induced pain and swelling associated with the inflammation process are also active in affecting other prostaglandin-regulated processes not associated with the inflammation
25 process. Thus, use of high doses of most common NSAIDs can produce severe side effects, including life threatening ulcers, that limit their therapeutic potential. An alternative to NSAIDs is the use of corticosteroids, which have even more drastic side
30 effects, especially when long term therapy is involved.

Previous NSAIDs have been found to prevent the production of prostaglandins by inhibiting enzymes in the human arachidonic acid/prostaglandin pathway,
35 including the enzyme cyclooxygenase (COX). The recent

discovery of an inducible enzyme associated with inflammation (named "cyclooxygenase-2 (COX-2)" or "prostaglandin G/H synthase II") provides a viable target of inhibition which more effectively reduces inflammation and produces fewer and less drastic side effects.

The references below that disclose antiinflammatory activity, show continuing efforts to find a safe and effective antiinflammatory agent. The novel benzopyran, dihydroquinoline, benzothiopyran and dihydronaphthalene derivatives disclosed herein are such safe and also effective antiinflammatory agents furthering such efforts. The substituted benzopyran, dihydroquinoline, benzothiopyran and dihydronaphthalene derivatives disclosed herein preferably selectively inhibit cyclooxygenase-2 over cyclooxygenase-1.

US Patent No. 5,618,843, to Fisher et al., generically describes acid substituted bicyclic moieties as IIb/IIIA antagonists. WO 94/13659, published June 23, 1994, describes fused benzo compounds for the treatment of CNS disorders. Manrao et al. (J. Indian. Counc. Chem., 12, 38-41 (1996)) describes carboxy coumarinimide derivatives and their antifungal activity. US Patent No. 5,348,976, to Shibata et al., describes amide substituted benzopyrans as antifungals.

WO96/40110, published December 19, 1996, describes benzopyran derivatives as tyrosine kinase modulators. Loiodice et al. (Tetrahedron, 6, 1001-11 (1995)) describe the preparation of 6-chloro-2,3-dihydro-4H-1-benzopyran carboxylic acids.

Clemence et al. (J. Med. Chem., 31, 1453-62, (1988)) describe 4-hydroxy-3-quinolinecarboxylic acids as starting material in the preparation of antiinflammatories. Lazer, et al. (J. Med. Chem., 40, 980-89 (1997)) describe

benzothiopyran carboxylates as starting material in the preparation of antiinflammatories.

Benzopyran-3-carboxylic acids have been described.

Gupta et al. (Indian J. Chem., 21B, 344-347 (1982)) describe

- 5 chromene-3-carboxylic acid as an intermediate in the preparation of centrally acting muscle relaxants. Rene and Royer (Eur. J. Med. Chem. - Chim. Ther., 10, 72-78 (1975)) describe the preparation of chromene-3-carboxylic acid. US Patent No. 4,665,202, to Rimbault et al., describes 2-phenyl
- 10 substituted flavenes and thioflavenes as 5-lipoxygenase inhibitors. U.S. Patent No. 5,250,547, to Lohead et al., describe benzopyran derivatives as 5-lipoxygenase inhibitors. Satoh et al. [J. Med. Chem., 36, 3580-94 (1993)] describe substituted chromenes as 5-lipoxygenase
- 15 inhibitors. U.S. Patent No. 5,155,130, to Stanton et al. describes substituted chromenes as 5-lipoxygenase inhibitors, and specifically 6-benzyloxy-2H-benzopyran-3-carboxylic acid as an intermediate.

- 20 However, compounds of the current invention have not been described as cyclooxygenase inhibitors.

The present invention comprises a pharmaceutical composition comprising a therapeutically-effective amount of a compound of Formula I in association with at least one pharmaceutically-acceptable carrier, adjuvant or diluent.

The present invention also comprises a method of treating cyclooxygenase-2 mediated disorders, such as inflammation, in a subject, the method comprising treating the subject having or susceptible to such

disorder with a therapeutically-effective amount of a compound of Formula I.

Also included in the family of compounds of Formula I are the stereoisomers thereof. Compounds of the present invention can possess one or more asymmetric carbon atoms and are thus capable of existing in the form of optical isomers as well as in the form of racemic or nonracemic mixtures thereof. Accordingly, some of the compounds of this invention may be present in racemic mixtures which are also included in this invention. The optical isomers can be obtained by resolution of the racemic mixtures according to conventional processes, for example by formation of diastereoisomeric salts by treatment with an optically active base and then separation of the mixture of diastereoisomers by crystallization, followed by liberation of the optically active bases from these salts. Examples of appropriate bases are brucine, strychnine, dehydroabietylamine, quinine, cinchonidine, ephedrine, α -methylbenzylamine, amphetamine, deoxyphedrine, chloramphenicol intermediate, 2-amino-1-butanol, and 1-(1-naphthyl)ethylamine. A different process for separation of optical isomers involves the use of a chiral chromatography column optimally chosen to maximize the separation of the enantiomers. Still another available method involves synthesis of covalent diastereoisomeric molecules. The synthesized diastereoisomers can be separated by conventional means such as chromatography, distillation, crystallization or sublimation, and then hydrolyzed to deliver the enantiomerically pure compound. The optically active compounds of Formula I can likewise be obtained by utilizing optically active starting materials. These isomers may be in the form of a free acid, a free base, an ester or a salt. Additional methods for resolving optical isomers, known to those skilled in the art may be used, for example, those discussed by J. Jaques et al in Enantiomers.

Also included in the family of compounds of Formula I and I' are the amide protected acids thereof. Thus primary and secondary amines can be reacted with the chromene-3-carboxylic acids of Formula I and I' to form amides which can be useful as prodrugs. Preferred amines heterocyclicamines, including optionally substituted aminothiazoles, optionally substituted amino-isoxazoles, and optionally substituted aminopyridines; aniline derivatives; sulfonamides; aminocarboxylic acids; and the like. Additionally, 1-acyldihydroquinolines can behave as prodrugs for the 1H-dihydroquinolines.

All of these salts may be prepared by conventional means from the corresponding compound of the invention by reacting, for example, the appropriate acid or base with the compound of Formula I or I'.

GENERAL SYNTHETIC PROCEDURES

The compounds of the invention can be synthesized according to the following procedures of Schemes 1-16, wherein the R¹-R⁶ substituents are as defined for Formulas I-II, above, except where further noted.

SCHEME 1

Synthetic Scheme 1 illustrates the general method for the preparation of a wide variety of substituted 2H-1-benzopyran derivatives 3 and 4. In step 1, a representative ortho-hydroxybenzaldehyde (salicylaldehyde) derivative 1 is condensed with an acrylate derivative 2 in the presence of base, such as potassium carbonate in a solvent such as dimethylformamide, to afford the desired 2H-1-benzopyran ester 3. An alternative base-solvent combination for this condensation includes an organic base such as triethylamine and a solvent such as dimethyl sulfoxide. In step 2 the ester is hydrolyzed to the corresponding acid, such as by treatment with aqueous base (sodium hydroxide) in a suitable solvent such as ethanol to afford after acidification the substituted 2H-1-benzopyran-3-carboxylic acid 4.

SCHEME 2

Synthetic Scheme 2 shows the general method for functionalizing selected 2H-1-benzopyrans. Treatment of the 2H-1-benzopyran carboxylic acid 4 or ester 3 with an electrophilic agent makes a 6-substituted 2H-1-benzopyran 5. A wide variety of electrophilic agents react selectively with 2H-1-benzopyrans 4 in the 6-position to provide new analogs in high yield. Electrophilic reagents such as halogen (chlorine or bromine) give the 6-halo derivatives. Chlorosulfonic acid reacts to afford the 6-position sulfonyl chloride that can further be converted to a sulfonamide or sulfone. Friedel-Crafts acylation of 4 provides 6-acylated 2H-1-benzopyrans in good to excellent yield. A number of other electrophiles can be used to selectively react with these 2H-1-benzopyrans in a similar

manner. A 6-position substituted 2H-1-benzopyran can react with an electrophilic reagent at the 8-position using similar chemistries to that described for electrophilic substitution of the 6-position. This yields an 2H-1-benzopyran which is substituted at both the 6 and 8 positions.

SCHEME 3

Synthetic Scheme 3 illustrates a second general synthesis of substituted 2H-1-benzopyran-3-carboxylic acids which allows substitution at position 4 of the 2H-1-benzopyran. In this case a commercially or synthetically available substituted ortho-hydroxy acetophenone **6** is treated with two or more equivalents of a strong base such as lithium bis(trimethylsilyl)amide in a solvent such as tetrahydrofuran (THF), followed by reaction with diethyl

carbonate to afford the beta-keto ester 7. Ester 7 is condensed with an acid chloride or anhydride in the presence of a base such as potassium carbonate in a solvent such as toluene with heat to afford 4-oxo-4H-1-benzopyran 8.

- 5 Reduction of the olefin can be accomplished by a variety of agents including sodium borohydride (NaBH_4) in solvent mixtures such as ethanol and tetrahydrofuran (THF), or by use of triethylsilane in a solvent such as trifluoroacetic acid, or by catalytic reduction using palladium on charcoal
- 10 and hydrogen gas in a solvent such as ethanol to yield the new beta-keto ester 9 (two tautomeric structures shown). Acylation of the oxygen of the ketone enolate in the presence of a base such as 2,6-di-tert-butyl-4-methylpyridine, an acylating agent such as
- 15 trifluoromethanesulfonic anhydride, and using a solvent such as methylene chloride yields the enol-triflate 10. Triflate 10 can be reduced with reagents such as tri-n-butyltin hydride, lithium chloride and a palladium (0) catalyst such as tetrakis(triphenylphosphine)palladium (0) in a solvent
- 20 such as tetrahydrofuran to yield 2H-1-benzopyran ester 11 where R" is hydrogen. The ester 11 can be saponified with a base such as 2.5 N sodium hydroxide in a mixed solvent such as tetrahydrofuran-ethanol-water (7:2:1) to yield the desired substituted 2H-1-benzopyran-3-carboxylic acid.

- 25 To incorporate a carbon fragment R' one can treat triflate 10 with reagents known to undergo "cross-coupling" chemistries such as tributylethylenyltin, lithium chloride and a palladium(0) catalyst such as tetrakis(triphenylphosphine)palladium (0) in a solvent such
- 30 as tetrahydrofuran to yield 2H-1-benzopyran ester 11 where R' is a vinyl moiety. The ester 6 can be saponified with a base such as 2.5 N sodium hydroxide in a mixed solvent such as tetrahydrofuran-ethanol-water (7:2:1) to yield the desired 4-vinyl-2H-1-benzopyran-3-carboxylic acid (12, R" =
- 35 $\text{CH}_2\text{CH-}$). Similarly triflate 10 can be converted under similar conditions using tri-n-butylphenyltin to 2H-1-benzopyran where R' = phenyl and by hydrolysis of the ester

converted to the carboxylic acid **12** where R^1 = phenyl.
 Using a similar strategy, substituents which be incorporated
 as substituent R^1 can be substituted olefins, substituted
 aromatics, substituted heteroaryl, acetylenes and substituted
 acetylenes.

SCHEME 4

Synthetic Scheme 4 shows an alternative general
 procedure for the preparation of 4-oxo-4H-1-benzopyran **8**.
 Treatment of an ortho-fluorobenzoyl chloride with an
 appropriately substituted beta-keto ester **14** with a base
 such as potassium carbonate in a solvent such as toluene
 provides 4-oxo-4H-1-benzopyran **8**. 4-oxo-4H-1-benzopyran **8**
 can be converted to 2H-1-benzopyran **12** as described in
 Scheme 3.

SCHEME 5

$Y = \text{Br}, \text{I}, \text{CF}_3\text{SO}_3$

Synthetic Scheme 5 shows a general method for
 substitution of the aromatic ring of the 2H-1-benzopyran.
 This can be accomplished through organo-palladium mediated
 "cross-coupling" chemistries using a palladium (0) catalyst
 to couple benzopyran **15** at position Y, where Y is iodide,
 bromide or triflate, with an acetylene, olefin, nitrile, or
 aryl coupling agent. Substituted acetylenes as the coupling
 agent will provide the corresponding substituted acetylene.

Substituted aryl moieties can be incorporated using arylboronic acids or esters; nitriles can be incorporated by use of zinc (II) cyanide. The resulting ester **16** can be converted to carboxylic acid **17** as described in Scheme 1.

5 Another approach to substitution of the aryl moiety of the benzopyran **15** is to convert Y, where Y is iodide or bromide, to a perfluoroalkyl moiety. Exemplary of this transformation is the conversion of **15** (Y = iodide) to **16** (R² = pentafluoroethyl) using a potassium

10 pentafluoropropionate and copper (I) iodide in hexamethylphosphoramide (HMPA). The resulting ester **16** can be converted to carboxylic acid **15** as described in Scheme 1.

A similar method adds substitution of the aromatic ring in dihydroquinoline-3-carboxylates. This can be
 15 accomplished through organopalladium couplings with aryl iodides, bromides, or triflates and various coupling agents (R. F. Heck, *Palladium Reagents in Organic Synthesis*. Academic Press 1985). When using a suitable palladium catalyst such as tetrakis(triphenyl-phosphine)palladium(0) in
 20 this reaction, coupling agents such as alkynes provide disubstituted alkynes, phenyl boronic acids afford biphenyl compounds, and cyanides produce arylcyano compounds. A number of other palladium catalysts and coupling reagents could be used to selectively react with appropriately
 25 substituted dihydroquinoline-3-carboxylates in a similar manner.

SCHEME 6

30 Synthetic Scheme 6 shows a general synthetic route for conversion of a commercially or synthetically available

substituted phenol into a substituted salicylaldehyde. Several different methods which utilize formaldehyde or a chemically equivalent reagent are described in detail below.

- Reaction of an appropriately substituted phenol **18** in basic media with formaldehyde (or chemical equivalent) will yield the corresponding salicylaldehyde **1**. The intermediate, ortho-hydroxymethylphenol **19**, will under appropriate reaction conditions be oxidized to the salicylaldehyde **1** in situ. The reaction commonly employs ethyl magnesium bromide or magnesium methoxide (one equivalent) as the base, toluene as the solvent, paraformaldehyde (two or more equivalents) as the source of formaldehyde, and employs hexamethylphosphoramide (HMPA) or *N,N,N',N'*-tetramethylethylenediamine (TMEDA). (See: Casiraghi, G. et al., J.C.S. Perkin I, **1978**, 318-321.)

- Alternatively an appropriately substituted phenol **18** may react with formaldehyde under aqueous basic conditions to form the substituted ortho-hydroxybenzyl alcohol **19** (See: a) J. Leroy and C. Wakselman, J. Fluorine Chem., **40**, 23-32 (1988). b) A. A. Moshfegh, et al., Helv. Chim. Acta., **65**, 1229-1232 (1982)). Commonly used bases include aqueous potassium hydroxide or sodium hydroxide. Formalin (38% formaldehyde in water) is commonly employed as the source of formaldehyde. The resulting ortho-hydroxybenzyl alcohol **19** can be converted to the salicylaldehyde **1** by an oxidizing agent such as manganese (IV) dioxide in a solvent such as methylene chloride or chloroform (See: R-G. Xie, et al., Synthetic Commun. **24**, 53-58 (1994)).

- An appropriately substituted phenol **18** can be treated under acidic conditions with hexamethylenetetramine (HMTA) to prepare the salicylaldehyde **1** (Duff Reaction; See: Y. Suzuki, and H. Takahashi, Chem. Pharm. Bull., **31**, 1751-1753 (1983)). This reaction commonly employs acids such as acetic acid, boric acid, methanesulfonic acid, or trifluoromethanesulfonic acid. The source of formaldehyde commonly used is hexamethylenetetramine.

SCHEME 7

Synthetic Scheme 7 shows the Reimer-Tiemann reaction in which an commercially or synthetically available appropriately substituted phenol **18** will under basic conditions react with chloroform to yield a substituted salicylaldehyde **1** (See: Cragoe, E.J.; Schultz, E.M., U.S. Patent 3 794 734, 1974).

SCHEME 8

Synthetic Scheme 8 shows the conversion of a commercially or synthetically available appropriately substituted salicylic acid **21** to its respective salicylaldehyde **1** via an intermediate 2-hydroxybenzyl alcohol **19**. Reduction of the salicylic acid **21** can be accomplished with a hydride reducing agent such as borane in a solvent such as tetrahydrofuran. Treatment of the intermediate 2-hydroxybenzyl alcohol **19** with an oxidizing agent such as manganese (IV) oxide in a solvent such as methylene chloride or chloroform provides salicylaldehyde **1**.

SCHEME 9

Synthetic Scheme 9 illustrates a general synthetic method for preparation of a wide variety of substituted 2-(trifluoromethyl)-2H-1-benzothiopyran-3-carboxylic acids (**25**). In step 1, an appropriately commercially or synthetically available substituted thiophenol **22** is ortho-metallated with a base such as *n*-butyllithium employing TMEDA (*N,N,N',N'*-tetramethylethylenediamine) followed by treatment with dimethylformamide to provide the 2-mercaptobenzaldehyde **23**. Condensation of the 2-mercaptobenzaldehyde **23** with an acrylate **2** in the presence of base provides ester **24** which can be saponified in the presence of aqueous base to afford the substituted 2H-1-benzothiopyran-3-carboxylic acids **25**.

SCHEME 10

- Synthetic Scheme 10 shows a method for preparing a substituted 2-mercaptobenzaldehyde from an appropriate commercially or synthetically available substituted salicylaldehyde. In step 1, the phenolic hydroxyl of salicylaldehyde 1 is converted to the corresponding O-aryl thiocarbamate 26 by acylation with an appropriately substituted thiocarbamoyl chloride such as *N,N*-dimethylthiocarbamoyl chloride in a solvent such as dimethylformamide using a base such as triethylamine. In Step 2, O-aryl thiocarbamate 26 rearranges to S-aryl thiocarbamate 27 when heated sufficiently such as to 200 °C using either no solvent or a solvent such as *N,N*-dimethylaniline (See: A. Levai, and P. Sebok, *Synth. Commun.*, 22 1735-1750 (1992)). Hydrolysis of S-aryl thiocarbamate 27 with a base such as 2.5 N sodium hydroxide in a solvent mixture such as tetrahydrofuran and ethanol yields the substituted 2-mercaptobenzaldehyde 23 which can be converted to the substituted 2H-1-benzothiopyran-3-carboxylic acids 25 as described in Scheme 9.

SCHEME 11

Synthetic Scheme 11 illustrates the general method for the preparation of a wide variety of dihydroquinoline-3-carboxylic acid derivatives 30. R^2 represents the aromatic substitution of commercially and synthetically available 2-aminobenzaldehydes 28. The 2-amino-benzaldehyde derivative 28, where R^2 represents various substitutions, is condensed with an acrylate derivative 2 in the presence of a base such as potassium carbonate, triethylamine, or diazabicyclo[2.2.2]undec-7-ene in solvents such as dimethylformamide to afford the dihydroquinoline-3-carboxylate esters 29. The ester 29 can be saponified to the corresponding acid, such as by treatment with aqueous inorganic base such as 2.5 N sodium hydroxide in a suitable solvent such as ethanol to afford after acidification the desired dihydroquinoline-3-carboxylic acid 30.

SCHEME 12

Synthetic Scheme 12 illustrates the preparation of dihydroquinoline-3-carboxylic acid **30** from 2-aminobenzoic acids **31**. R^2 represents the aromatic substitution of commercially and synthetically available 2-aminobenzoic acids **31**. Reduction of the representative 2-aminobenzoic acid **31** to the desired 2-aminobenzyl alcohol **32** was accomplished with a hydride reducing agent such as borane in a solvent such as tetrahydrofuran. Treatment of the desired 2-aminobenzyl alcohol **32** with an oxidizing agent such as manganese(IV)oxide in a solvent such as methylene chloride provides the representative 2-aminobenzaldehydes **28**. (C. T. Alabaster, et al. *J. Med. Chem.* 31, 2048-2056 (1988)) The 2-aminobenzaldehydes were converted to the desired dihydroquinoline-3-carboxylic acid **30** as described in Scheme 11.

SCHEME 13

Synthetic Scheme 13 illustrates the general method for the preparation of a wide variety of dihydroquinoline-3-carboxylic acid derivatives **30** from isatins **33**. R^2 represents the aromatic substitution of commercially and synthetically available isatins **33**. A representative isatin **33** was treated with basic peroxide generated from hydrogen peroxide and a base such as sodium hydroxide to afford the desired representative 2-aminobenzoic acids **31**. (M. S. Newman and M. W. Lougue, J. Org. Chem., **36**, 1398-1401 (1971)) The 2-aminobenzoic acids **31** are subsequently converted to the desired dihydroquinoline-3-carboxylic acid derivatives **30** as described in synthetic Scheme 12.

SCHEME 14

15

Synthetic Scheme 14 is another general method for the preparation of dihydroquinoline-3-carboxylic acid derivatives **30**. In step 1, an appropriate commercially or synthetically available substituted aniline **34** can be treated with an acylating reagent such as pivaloyl chloride

- yielding an amide **35**. The *ortho*-dianion of amide **35** is prepared by treating amide **35** with organo-lithium bases such as *n*-butyllithium or *tert*-butyllithium in tetrahydrofuran at low temperature. The dianion is quenched with
- 5 dimethylformamide to afford the acylated-2-amino-benzaldehydes **36**. (J. Turner, *J. Org. Chem.*, 48, 3401-3408 (1983)) Reaction of these aldehydes in the presence of bases such as lithium hydride with an acrylate followed by
- 10 work up with aqueous inorganic bases and hydrolysis, such as by treatment with aqueous base (sodium hydroxide) in a suitable solvent such as ethanol affords, after acidification, a dihydroquinoline-3-carboxylic acid **30**.

SCHEME 15

- 15 Synthetic Scheme 15 shows a general method for alkylation of the nitrogen of dihydroquinoline-3-carboxylate ester derivatives **29**. The step involves treatment of dihydroquinoline-3-carboxylate ester derivatives **29** with alkyl halides such as iodoethane in the presence of phase
- 20 transfer catalysts such as tetrabutylammonium iodide, and a base such as caustic (50% aqueous sodium hydroxide) in a solvent such as dichloromethane. These conditions afford the N-alkylated dihydroquinoline-3-carboxylate esters **37**.

Saponification of 37 with aqueous base provides N-alkylated-dihydroquinoline-3-carboxylic acid derivatives 38.

6-(Methylthio)-2-(trifluoromethyl)-2H-1-benzopyran-3-carboxylic acid

Step 1. Preparation of 5-(methylthio)salicylaldehyde.

Ethyl magnesium bromide (38 mL of a 3.0 M solution in diethyl ether, 113.8 mmole) was chilled with an ice-water bath. To the chilled solution was added a solution of 4-(methylthio)phenol (15.95 g, 113.8 mmole) in diethyl ether (30 mL) over 0.15 hour during which time gas was evolved. The reaction was held at 0 °C for 0.5 hour, at room temperature for 0.5 hour, and the addition funnel replaced with a distillation head. Toluene (250 mL) and the diethyl ether were distilled out of the reactor. The reaction was cooled, toluene (250 mL) and hexamethylphosphoramide (HMPA) (19.8 mL, 20.4 g, 113.8 mmole) were added, and the resulting mixture was stirred for 0.25 hours. The distillation head was replaced with a condenser and paraformaldehyde (8.5 g, 284.4 mmole) was added. The reaction was heated to 90 °C for 3 hours. The reaction mixture was cooled to room temperature, was acidified with 1N HCl and the layers separated. The organic phase was washed with water, and with brine, dried over MgSO_4 , filtered, and concentrated in vacuo to yield a solid. This solid was purified by silica chromatography (hexanes-ethyl acetate, 5:1) yielding the salicylaldehyde as a yellow

The mixture was heated to 65 °C for 3 h. The reaction was cooled to room temperature, poured into H₂O (50 mL), and extracted with diethyl ether (2 X 75 mL). The combined ethereal phases were washed with aqueous NaHCO₃ solution (3 X 50 mL), aqueous 2 N HCl solution (3 X 50 mL), and brine (3 X 50 mL), dried over MgSO₄, filtered, diluted with isooctane and partially concentrated in vacuo causing the precipitation of the ethyl ester (2.863 g, 60 %) as a yellow powder: mp 87.8-89.6 °C This ester was of suitable purity to use without further purification.

6-Chloro-7-(1,1-dimethylethyl)-2-trifluoromethyl-2H-1-benzopyran-3-carboxylic acid

25

Step 1. Preparation of 4-tert-butylsalicylaldehyde.

A five liter three-neck round bottom flask equipped with overhead mechanical stirrer and condenser was charged with trifluoroacetic acid (2.4 L). A mixture of 3-tert-butylphenol (412 g, 2.8 mole) and HMTA (424 g, 3.0 mole) was

30

added portion-wise causing an exotherm. With cooling, the temperature was maintained under 80 °C. The reaction was heated at 80 °C for one hour, then cooled, and water (2 L) added. After 0.5 hour additional water (4 L) was added and the mixture was extracted with ethyl acetate (6 L). The organic extract was washed with water and brine. The resulting organic phase was divided into 2 L volumes and each diluted with water (1 L), and solid NaHCO₃ added until the mixture was neutralized. The organic phases were isolated and combined, dried over MgSO₄, filtered and concentrated *in vacuo* yielding an oil. This oil was distilled at 95 °C (0.8 mm) yielding the desired salicylaldehyde as an oil (272.9 g, 56 %) which was of sufficient purity to be used without further purification.

Step 2. Preparation of ethyl 7-(1,1-dimethylethyl)-2-(trifluoromethyl)-2H-1-benzopyran-3-carboxylate.

A one liter three-neck flask was charged with 4-*tert*-butylsalicylaldehyde (Step 1) (100.0 g, 0.56 mole), dimethylformamide (110 mL), and potassium carbonate (79.9 g, 0.58 mole) causing the temperature of the mixture to rise to 40 °C. Ethyl 4,4,4-trifluorocrotonate (118.0 g, 0.70 mole) in dimethylformamide (110 mL) was added and the mixture heated to 60 °C at which time the reaction temperature rose to 70 °C. The reaction was cooled to 60 °C, maintained at 60 °C (with added heating) for 8.5 hours and cooled to room temperature. Ethyl acetate (600 mL) and 3 N HCl (600 mL) were added, mixed, and the layers separated. The aqueous phase was extracted with ethyl acetate and the organic phases were combined. The combined organic phases were washed with brine-water (1:1), brine, dried over MgSO₄, filtered and concentrated *in vacuo*, yielding a semi-solid. Hexane (600 mL) was added with mixing and the mixture was filtered. The filtrate was washed with brine, dried over MgSO₄, filtered and concentrated *in vacuo* yielding a solid. This solid was dissolved in hot ethanol (600 mL). Water

- (190 mL) was added which induced crystallization. Filtration of the mixture and drying of the product provided the desired ester as a crystalline solid (131.3 g, 71%): mp 91.0-94.9 °C. This material was of suitable purity to be used in subsequent steps without further purification.

Step 3. Preparation of ethyl 6-chloro-7-(1,1-dimethylethyl)-2-(trifluoromethyl)-2H-1-benzopyran-3-carboxylate.

- 10 A one liter three-neck flask equipped with mechanical stirrer and gas inlet tube was charged with the ester (Step 2) (100 g, 0.3 mole) and acetic acid (300 mL). While cooling (water bath) the reaction mixture, chlorine gas (37.6 g, 0.53 mole) was added which caused the temperature
- 15 to rise to 48 °C. After stirring for two hours, the reaction was cooled in an ice-water bath to 15 °C. Zinc powder (19.5 g, 0.3 mole) was added in one portion which caused the temperature to rise to 72 °C. After cooling to room temperature additional zinc powder (5.0 g, 0.08 mole)
- 20 was added and the mixture was stirred for 0.5 hour longer. The crude mixture was filtered through diatomaceous earth and was concentrated *in vacuo* yielding an oil. The oil was dissolved in ethyl acetate (700 mL) washed with brine-water (1:1, 1 L) and brine (0.5 L). The resulting aqueous phase
- 25 was extracted with ethyl acetate (700 mL). This ethyl acetate phase was washed with brine-water (1:1, 1 L) and brine (0.5 L). The combined organic phases were dried over MgSO₄, filtered and concentrated *in vacuo* yielding the title compound as a yellow oil (116 g, 106 %). This material,
- 30 which contained some entrained ethyl acetate, was of suitable purity to be used in subsequent steps without further purification.

Step 4. Preparation of 6-chloro-7-(1,1-dimethylethyl)-2-(trifluoromethyl)-2H-1-benzopyran-3-carboxylic acid.

- 35 To a solution of the ester (Step 3) (116 g, 0.3 mole) in methanol (500 mL) and tetrahydrofuran

(500 mL) in a one liter flask was added aqueous sodium hydroxide (2.5 N, 240 mL, 0.6 mole). After stirring overnight, the pH of the solution was adjusted to 1 with concentrated hydrochloric acid and the solution was extracted with ethyl acetate. The ethyl acetate phase was dried over MgSO_4 , filtered and concentrated *in vacuo* yielding a solid. This solid was dissolved in hot ethanol (500 mL). Water (500 mL) was added and upon cooling to room temperature crystals formed which were collected by vacuum filtration. The crystals were washed with ethanol-water (3:7, 3 X 200 mL) and dried providing the title acid as a crystalline solid (91.6 g, 91 %): mp 194.9-196.5 °C. ^1H NMR (acetone- d_6 /300 MHz) 7.86 (s, 1H), 7.52 (s, 1H), 7.12 (s, 1H), 5.83 (q, 1H, J = 7.1 Hz), 1.48 (s, 9H). 6-Iodo-2-trifluoromethyl-2H-1-benzopyran-3-carboxylic acid

Step 1: Preparation of 2-hydroxy-5-iodobenzyl alcohol.

A solution of 5-iodosalicylic acid (25.0 g, 94.6 mmol) in tetrahydrofuran (500 mL) was cooled to 0°C. With vigorous mixing, borane-methyl sulfide complex (15.1 ml of 10 M solution, 151.0 mmol) was added drop-wise over 0.25 hours. The solution was warmed to room temperature and then heated at reflux for 4 h. A white precipitate formed during the reflux. The solution was cooled to room temperature and 10% aqueous hydrochloric acid (100 mL) was added over 15 min and the solution stirred at room temperature for 2 h. The precipitate dissolved and the solvent was concentrated in vacuo to a volume of approximately 200 mL. The solution was poured into ethyl acetate (300 mL) and washed with water (2 x 200 mL), saturated sodium bicarbonate (2 x 200 mL), and saturated ammonium chloride (2 x 200 mL). The organic layer was dried over sodium sulfate and concentrated in vacuo. The 2-hydroxy-5-iodobenzyl alcohol was isolated as a white solid (21.3 g, 85.2 mmol) from hexanes. (90% yield): mp 105-110°C. ¹H NMR (CDCl₃/300 MHz) 8.21 (s, 1H), 7.30-7.33 (M, 2H), 6.57 (d, 1H, *J* = 8.3 Hz), 4.97 (bs, 1H), 4.62 (s, 2H). EIHRMS *m/z* = 249.9492 (*M*⁺, Calc'd 249.9491).

Step 2: Preparation of 2-hydroxy-5-iodobenzaldehyde

To a stirred solution of 2-hydroxy-5-iodobenzyl alcohol (43.5 g, 174.0 mmol) in acetone (700 mL) was added 85% activated manganese(IV) oxide (5 micron, 50 g, 494.0 mmol) and the solution stirred at room temperature for 16 hours. The manganese oxide was removed by filtration through diatomaceous earth and the filtrate concentrated in vacuo. The product was purified by flash silica chromatography (0-

20% ethyl acetate in hexanes) The 2-hydroxy-5-iodobenzaldehyde was obtained as a greenish-yellow solid (24.3 g, 58%). A small amount of the 2-hydroxy-5-iodobenzaldehyde was recrystallized from methanol/water to afford an analytical sample and the remainder of the compound was used without further purification: mp 99-101 °C. ¹H NMR (CDCl₃/300 MHz) 9.83 (s, 1H), 7.79 (d, 1H, J = 2.2 Hz), 7.77 (dd, 1H, J = 8.7 Hz, J = 2.2 Hz), 6.81 (d, 1H, J = 8.7 Hz). Step 3: Preparation of ethyl 6-iodo-2-(trifluoromethyl)-2H-1-benzopyran-3-carboxylate.

The solution was poured into ethyl acetate (300 mL) and washed with 1N hydrochloric acid (3 x 200 mL). The aqueous layers were combined and extracted with ethyl acetate (1 x 100 mL). The combined ethyl acetate extracts were washed with saturated ammonium chloride (2 x 200 mL), dried over magnesium sulfate and concentrated in vacuo yielding a dark red oil. This oil was purified by flash chromatography using ethyl acetate-hexanes (3:7) yielding a red oil. Crystallization of this oil from hexanes yielded the title compound as light red crystals (8.3 g, 31%): mp 105-106 °C. ¹H NMR (CDCl₃/300 MHz) 7.63 (s, 1H), 7.58 (dd, 2H, J = 8.6, J = 2.1 Hz, 7.54 (d, 1H, J = 2.1 Hz), 6.77 (d, 1H, J = 8.6 Hz), 5.70 (q, 1H, J = 6.7 Hz), 4.20-4.38 (m 2H), 1.35 (t, 3H, J = 7.2 Hz). 6-Chloro-2-trifluoromethyl-2H-1-benzothiopyran-3-carboxylic acid

Step 1: Synthesis of 5-chloro-thiosalicylaldehyde.

Tetramethylethylenediamine (TMEDA) (10.44 mL, 8.035 g, 69.15 mmol) was added via syringe to n-BuLi (43.22 mL of 1.6 M in hexanes, 69.15 mmol) and the solution was chilled to 0 °C. A solution of 4-chlorothiophenol (5.00 g, 34.57 mmol) in cyclohexane (25 mL) was added with stirring over 1 hour. The resulting tan slurry was stirred overnight at room temperature, chilled to 0 °C, and DMF (2.94 mL, 2.78 g, 38.03 mmol) was added via syringe over 2 minutes. The resulting gummy slurry was stirred at room temperature for 30 hours and became a powdery suspension. A mixture of 2 N HCl and ice was added to the reaction mixture until the pH

Step 2. Preparation of ethyl 2,6-bis(trifluoromethyl)-4-oxo-dihydrobenzopyran-3-carboxylate.

A 250 mL round bottom flask was charged with ethyl 2,6-bis(trifluoromethyl)-benzopyran-4-one-3-carboxylate (Step 1) (2.307 g, 6.513 mmol) and THF (20 mL) yielding a pale yellow solution. Ethanol (20 mL) was added and the reaction chilled in an ice-salt bath. While maintaining the reaction temperature at below 9 °C, $NaBH_4$ (0.246 g, 6.513 mmol) was added in two portions and the mixture stirred 1 h. The crude reaction mixture was poured into a vigorously stirred mixture of ice (200 mL) and concentrated HCl (12 N, 5 mL) yielding a precipitate. Vacuum filtration of the resulting suspension yielded the desired keto ester (2.204 g, 87%) as faint pink powder of suitable purity to use in the next step without further purification: mp 71.8-76.9 °C. 1H NMR (acetone- d_6 /300 MHz) 12.71 (br s, 1H exch), 8.01 (d, 1H, $J = 2.0$ Hz), 8.01 (d, 1H, $J = 2.0$ Hz), 7.88 (dd, 1H, $J = 8.7$, 1.8 Hz), 7.31 (d, 1H, $J = 8.7$ Hz), 5.98 (q, 1H, $J = 6.6$ Hz), 4.51-4.28 (m, 2H), 1.35 (t, 3H, $J = 7.0$ Hz). Step 3. Preparation of ethyl 2,6-bis(trifluoromethyl)-4-trifluoromethanesulfonato-2H-1-benzopyran-3-carboxylate.

A 50 mL 3-neck Morton flask fitted with addition funnel, 2 stoppers was charged with 2,6-di-*tert*-butylpyridine (1.576 g, 1.50 mmol), methylene chloride (12 mL), and then via syringe was added trifluoromethanesulfonic anhydride (1.08 mL, 1.80 g, 1.25 mmol). To this solution was added dropwise a solution the keto ester (Step 2) (1.822

g, 5.115 mmol) in methylene chloride (10 mL) over 0.33 h and the reaction stirred for 48 h. The resulting off-white suspension was transferred to a 100 mL round bottom flask and was concentrated *in vacuo*. The residue was suspended in diethyl ether (50 mL) and vacuum filtered to remove salts. The filtrate was further diluted with diethyl ether (50 mL) and was washed with ice cold HCl solution (2 N), brine, and dried over Na_2CO_3 , filtered and concentrated *in vacuo* yielding the desired triflate (1.64 g, 66%) as a tan clumpy powder of suitable purity to use in the next step without further purification.

Step 4. Preparation of ethyl 2,6-bis(trifluoromethyl)-2H-1-benzopyran-3-carboxylate.

A 25 mL pear flask was charged with LiCl (0.136 g, 3.219 mmol), affixed to a high vacuum line and heated with a heat gun removing superficial water. The flask was allowed to cool to room temperature, and tetrakis(triphenylphosphine)palladium(0) (0.124 g, 0.107 mmol) and THF (2 mL) were added. A reflux condenser was affixed to the flask and the apparatus was purged with nitrogen. A solution of the triflate (Step 3) (0.524 g, 1.073 mmol) in THF (2 mL) and tri-n-butyltin hydride (0.32 mL, 0.34 g, 1.18 mmol) were added sequentially via syringe. The resulting light orange solution was heated to 50 °C with stirring for 1 h, 60 °C for one hour, and 65 °C for one hour. The reaction was allowed to cool to room temperature and was poured into 2 N HCl, stirred, and extracted with hexanes. The hexane phase was dried over MgSO_4 , filtered and concentrated yielding a light brown oil. The oil was dissolved in hexane and was washed with aqueous ammonium fluoride solution. The resulting hexane phase was dried over MgSO_4 , filtered and concentrated *in vacuo* yielding a dull yellow oily solid which solidified as a flaky powder (0.443 g). This solid was purified by flash silica chromatography (eluant: hexanes-methylene chloride, 4:1) yielding ethyl 2,6-di-trifluoromethyl-2H-1-benzopyran-3-

carboxylate(0.069 g, 19 %) as a white crystalline solid of suitable purity to proceed with the next step.

Step 5. Preparation of 2,6-bis(trifluoromethyl)-2H-1-benzopyran-3-carboxylic acid.

To a stirred solution of the ester (Step 4) (0.065 g, 0.191 mmol) in THF-EtOH-H₂O (7:2:1, 1 mL) was added NaOH solution (0.084 mL, 0.210 mmol) in one portion at room temperature and allowed to stir overnight. The reaction was partially concentrated in vacuo yielding a pale yellow clear syrup. The syrup was diluted with water (5 mL) and brine (1mL) and was washed with diethyl ether (3 X 5 mL). The resulting aqueous phase was sparged with nitrogen to remove trace ether. With stirring, concentrated HCl was added to the aqueous phase causing the formation of a very fine white precipitate. This suspension was extracted with diethyl ether and the ether dried over Na₂SO₄, filtered, and concentrated by slow evaporation at atmospheric pressure. The resulting product was recrystallized from hexanes and ethyl acetate yielding the title compound (0.038 g, 64 %) as a fine tan powder: mp 143.5-145.2 °C. ¹H NMR (acetone-d₆/300 MHz) 11.97-11.67 (br s, 1H), 8.03 (s, 1H), 7.92 (s, 1H), 7.77 (d, 1H, *J* = 8.5 Hz), 7.26 (d, 1H, *J* = 8.7 Hz), 5.96 (q, 1H, *J* = 7.0 Hz). EXAMPLE 100

8-Chloro-6-(4-chlorophenoxy)-2-trifluoromethyl)-2H-1-benzopyran-3-carboxylic acid

5 Step 1. Preparation of 5-phenoxyisalicylaldehyde.

Ethyl magnesium bromide (67.5 mL of an approximately 3.0 M solution in diethyl ether, 202.5 mmol) was added to toluene (50 mL). A solution of 4-phenoxyphenol (25.00 g, 134.26 mmol) in diethyl ether (35 mL) was added resulting in the evolution of gas. The reaction was heated to 80 °C causing distillation of the diethyl ether. Toluene (300 mL), HMPA (23.4 mL, 24.059 g, 134.26 mmol), and paraformaldehyde (10.07 g, 335.65 mmol) were added and the reaction was heated to 85 °C for 4 hours. The reaction was cooled to room temperature and was acidified with 2N HCl. The resulting layers were separated and the organic phase collected. The organic phase was washed with brine. The combined aqueous phases were extracted with methylene chloride. The organic phases were combined, dried over MgSO₄, filtered and concentrated in vacuo yielding a yellow oil. The oil was purified by silica flash chromatography (hexanes-ethyl acetate, 95:5). Concentration in vacuo of the desired fractions provided the salicylaldehyde as a pale yellow powder (12.0 g, 42%) of suitable purity to use in subsequent steps.

Step 2. Preparation of 3-chloro-5-(4-chlorophenoxy)salicylaldehyde.

To a stirred solution of the salicylaldehyde (Step 1) (0.981 g, 4.58 mmol) in acetic acid (20 mL) was added chlorine gas via a tube until the yellow color of chlorine persisted. After stirring for four hours at room temperature the reaction was sparged with nitrogen and diluted with water (50 mL). The resulting oily suspension was extracted with methylene chloride. The methylene chloride phase was washed with sodium bisulfite solution, dried over MgSO₄, filtered and concentrated in vacuo

providing the dichlorinated salicylaldehyde as a yellow oil (0.66 g, 51%) of suitable purity for use in subsequent steps without further purification.

5 Step 3. Preparation of ethyl 8-chloro-6-(4-chlorophenoxy)-2-(trifluoromethyl)-2H-1-benzopyran-3-carboxylate.

A mixture of the dichlorinated salicylaldehyde (Step 2) (0.66 g, 2.3 mmol), triethylamine (0.49 g, 4.8 mmol), ethyl 4,4,4-trifluorocrotonate (0.59 g, 3.5 mmol) in dimethyl
10 sulfoxide (5 mL) was heated to 85 °C for 3.5 hours. The reaction was allowed to cool to room temperature and was diluted with ethyl acetate (50 mL). The resulting mixture was washed with 3 N HCl (50 mL), aqueous potassium carbonate solution (10 weight %, 2 X 30 mL), and brine. The organic
15 phase was dried over MgSO₄, filtered and concentrated in vacuo yielding a brown oil. This oil was purified by flash silica chromatography (hexanes-ethyl acetate, 9:1) providing the substituted 2H-1-benzopyran (0.39 g, 39%) of suitable purity to use in subsequent steps without further
20 purification.

Step 4. Preparation of 8-chloro-6-(4-chlorophenoxy)-2-(trifluoromethyl)-2H-1-benzopyran-3-carboxylic acid.

To a solution of the substituted 2H-1-benzopyran ethyl
25 ester (Step 3) (0.37 g, 0.85 mmol) in ethanol-THF (4 mL, 1:1) was added sodium hydroxide solution (2 mL of 2.5 N, 5 mmol). After stirring for six hours the mixture was concentrated in vacuo. Acidification of the mixture with 3 N HCl yielded a solid which was collected by vacuum filtration. This solid
30 was recrystallized from ethanol-water yielding the title compound as yellow crystals (0.134 g, 38%): mp 227.8-228.9 °C. ¹H NMR (acetone-d₆/300 MHz) 7.93 (s, 1H), 7.42 (d, 2H, J = 8.9 Hz), 7.24 (s, 2H), 7.12 (d, 2H, J = 8.9 Hz), 5.97 (q, 1H, J = 7.1 Hz). FABLRMS m/z 403 (M-H). FABHRMS m/z

6-Chloro-2-(trifluoromethyl)-4-ethenyl-2H-1-benzopyran-3-carboxylic acid

Step 1: Preparation of ethyl 3-(5-chloro-2-hydroxyphenyl)-3-oxo-propionate

A solution of lithium hexamethyldisilazide (800 mL of 1.0 M solution in THF, 800.0 mmol) was chilled to -78 °C under a nitrogen atmosphere. A solution of 5-chloro-2-hydroxyacetophenone (45.493 g, 266.67 mmol) in THF (130 mL)

was added dropwise to the stirred solution over 0.5 hour. The reaction was held at -78 °C for 1 hour, warmed to -10 °C for 2 hours, warmed to 0 °C for 1 hour, then cooled to -78 °C. Diethyl carbonate (35.54 mL, 34.65 g, 29.34 mmol) was added via syringe in one portion. The temperature was maintained at -78 °C for 0.5 hour, warmed to room temperature over 0.5 hour, and stirred for 3 hours. The crude reaction mixture was carefully poured over a mixture of rapidly stirred ice (1200 mL)/conc HCl (222 mL). The layers were separated and the aqueous phase was extracted with ethyl acetate. The combined organic phase was washed with brine, dried over Na₂SO₄, filtered and concentrated in vacuo yielding an oil that began to crystallize. Hexanes (150 mL) was added and crystallization proceeded. The crystalline product was collected by vacuum filtration to afford the title compound (29.04 g, 45%) as tan crystalline needles: mp 71.8-73.1 °C. ¹H NMR (CDCl₃/300 MHz) 7.63 (d, 1H, J = 2.4 Hz), 7.45 (dd, 1H, J = 8.9, 2.6), 6.98 (d, 1H, J = 8.9 Hz), 4.25 (q, 2 H, J = 7.3 Hz), 3.98 (s, 2H), 1.29 (t, 3H, 7.3 Hz). FABLRMS m/z 249 (M+Li). EIHRMS m/z 242.0346 (M+, Calc'd 242.0346). Anal. Calc'd for C₁₁H₁₁ClO₄: C, 54.45; H, 4.57. Found: C, 54.48; H, 4.62.

Step 2. Preparation of ethyl 2-(trifluoromethyl)-6-chloro-4-oxo-4H-1-benzopyran-3-carboxylate.

This suspension was stirred at room temperature for 36 hours, then heated to reflux for 4 hours. After cooling to room temperature, the suspension was poured over rapidly stirred (mechanical stirrer) ice (300 mL) and aqueous HCl (12 N, 50 mL). The resulting organic phase was separated from the clear mixture, was washed with water (5 X 500 mL), brine (1 X 500 mL), dried over MgSO₄, filtered and concentrated in vacuo yielding tan solid which was dried under high vacuum. This sample was partially dissolved in

- 30 The substituted pyridine from Step 3 (1.7 g, 11 mmol), anhydrous potassium carbonate (3.0 g, 22 mmol), and ethyl 4,4,4-trifluorocrotonate (3.3 mL, 22 mmol) were mixed in anhydrous dimethylformamide (20 mL) and heated at 80 °C for 2 hours. The reaction was allowed to cool to room temperature
- 35 and was partitioned between ethyl acetate (100 mL) and water (100 mL). The aqueous layer was

extracted with more ethyl acetate (100 mL). The combined organic extracts were washed with brine (100 mL), dried over MgSO_4 , and concentrated in vacuo yielding a waxy amber solid. The solid was trituated with diethyl ether providing the ester as a yellow solid (613 mg, 18%). A small amount was recrystallized from ethyl acetate for analytical data: mp 180.1-181.9 °C. ^1H NMR (CDCl_3 /300 MHz) 7.99 (s, 1H), 7.61 (s, 1H), 7.39 (s, 1H), 6.00 (br s, 1H), 5.33-5.20 (m, 1H), 4.40-4.23 (m, 2H), 1.40-1.30 (m, 3H). The mixture was heated at 50 °C for 4 hours, allowed to cool to room temperature, and was concentrated in vacuo to remove the tetrahydrofuran and methanol. The resulting aqueous solution was washed with diethyl ether (2 x 100 mL). The aqueous phase was acidified with 3 N HCl causing the precipitation of a yellow solid (1.1 g). The solid was trituated with ethanol-acetone and collected by vacuum filtration providing the title compound as a yellow solid (276 mg, 23%): mp 287.4-288.4 °C. ^1H NMR (acetone- d_6 /300 MHz) 11.50 (br s, 1H), 8.03 (s, 1H), 7.83 (s, 1H), 7.75 (s, 1H), 7.28 (br s, 1H), 5.42-5.30 (m, 1H). (S)-6,8-Dichloro-2-(trifluoromethyl)-2H-1-benzopyran-3-carboxylic acid

- 6,8-Dichloro-2-(trifluoromethyl)-2H-1-benzopyran-3-carboxylic acid (Example 32) (300 g, 1.04 mol) was added to ethyl acetate (750 mL). The mixture was stirred for 5 minutes, warmed to 70 °C and held at this temperature for 5 minutes. The resulting solution was cooled to 50 °C and
- 15 (s)-(-)- α -methylbenzylamine (58 g, 0.48 mol) was added. Heptane (1880 mL) was added and the mixture stirred for 0.5 hour, then stirring was discontinued. The reaction was allowed to cool to 22 °C and stand for 8 hours. The salt
- 20 crystallized during this time and was collected by vacuum filtration. The solid was washed with ethyl acetate-heptane (1:3, 2 X 50 mL). The solid obtained was dried at 40 °C under vacuum (20 mm) for 24 hours to give the salt (35 g, 16 %).
- 25 A three-neck 2 L round bottom flask was purged with nitrogen and was charged with deionized water (750 mL) and the salt (103 g, 0.24 mole; This material was obtained using a similar procedure to that described above). To the
- 30 resulting stirred suspension was added concentrated HCl (37 mL) drop-wise over 0.5 hours with good stirring below 20 °C causing the free carboxylic acid to precipitate. After stirring

for 2 hours, the suspension was vacuum filtered and the solid washed with deionized water (5 X 50 mL; until the washings were neutral). The solid was dried at 40 °C under vacuum (20 mm) for 12 hours yielding the title compound as a solid (74 g, 100%): mp 166.0-168.4 °C. ¹H NMR (acetone-*d*₆/300 MHz) 7.94 (s, 1H), 7.60 (s, 2H), 6.04 (q, 1H, *J* = 6.8 Hz). ESHRMS *m/z* 310.9489 (M-H, Calc'd 310.9450). This compound was determined to have an optical purity of greater than 90% ee. The optical purity was determined by the method described in Example 66.

Rat Carrageenan Foot Pad Edema Test

The carrageenan foot edema test was performed with materials, reagents and procedures essentially as described by Winter, et al., (*Proc. Soc. Exp. Biol. Med.*, 111, 544 (1962)). Male Sprague-Dawley rats were selected in each group so that the average body weight was as close as possible. Rats were fasted with free access to water for over sixteen hours prior to the test. The rats were dosed orally (1 mL) with compounds suspended in vehicle containing 0.5% methylcellulose and 0.025% surfactant, or with vehicle alone. One hour later a subplantar injection of 0.1 mL of 1% solution of carrageenan/sterile 0.9% saline was administered and the volume of the injected foot was measured with a displacement plethysmometer connected to a pressure transducer with a digital indicator. Three hours after the injection of the carrageenan, the volume of the foot was again measured. The average foot swelling in a group of drug-treated animals was compared with that of a group of placebo-treated animals and the percentage inhibition of edema was determined (Otterness and Bliven, *Laboratory Models for Testing NSAIDs*, in *Non-steroidal Anti-Inflammatory Drugs*, (J. Lombardino, ed. 1985)). The %

inhibition shows the % decrease from control paw volume determined in this procedure and the data for selected compounds in this invention are summarized in Table I.

Evaluation of COX-1 and COX-2 activity *in vitro*

- 15 The compounds of this invention exhibited inhibition *in vitro* of COX-2. The COX-2 inhibition activity of the compounds of this invention illustrated in the Examples was determined by the following methods.

20 a. Preparation of recombinant COX baculoviruses

- Recombinant COX-1 and COX-2 were prepared as described by Gierse et al, [*J. Biochem.*, 305, 479-84 (1995)]. A 2.0 kb fragment containing the coding region of either human or murine COX-1 or human or murine COX-2 was cloned into a
- 25 BamH1 site of the baculovirus transfer vector pVL1393 (Invitrogen) to generate the baculovirus transfer vectors for COX-1 and COX-2 in a manner similar to the method of D.R. O'Reilly et al (*Baculovirus Expression Vectors: A Laboratory Manual* (1992)). Recombinant baculoviruses were
- 30 isolated by transfecting 4 μ g of baculovirus transfer vector DNA into SF9 insect cells (2×10^8) along with 200 ng of linearized baculovirus plasmid DNA by the calcium phosphate method. See M.D. Summers and G.E. Smith, *A Manual of Methods for Baculovirus Vectors and Insect Cell Culture Procedures*,
- 35 Texas Agric. Exp. Station Bull. 1555 (1987). Recombinant viruses were purified by three rounds of plaque purification and high titer (10^7 - 10^8 pfu/mL) stocks of virus were prepared. For large scale production, SF9 insect cells were

infected in 10 liter fermentors (0.5×10^6 /mL) with the recombinant baculovirus stock such that the multiplicity of infection was 0.1. After 72 hours the cells were centrifuged and the cell pellet homogenized in Tris/Sucrose (50 mM: 25%, pH 8.0) containing 1% 3-[(3-cholamidopropyl)dimethylammonio]-1-propanesulfonate (CHAPS). The homogenate was centrifuged at 10,000xG for 30 minutes, and the resultant supernatant was stored at -80°C before being assayed for COX activity.

b. Assay for COX-1 and COX-2 activity

COX activity was assayed as PGE₂ formed/ μ g protein/time using an ELISA to detect the prostaglandin released. CHAPS-solubilized insect cell membranes containing the appropriate COX enzyme were incubated in a potassium phosphate buffer (50 mM, pH 8.0) containing epinephrine, phenol, and heme with the addition of arachidonic acid (10 μ M). Compounds were pre-incubated with the enzyme for 10-20 minutes prior to the addition of arachidonic acid. Any reaction between the arachidonic acid and the enzyme was stopped after ten minutes at 37 °C/room temperature by transferring 40 μ l of reaction mix into 160 μ l ELISA buffer and 25 μ M indomethacin. The PGE₂ formed was measured by standard ELISA technology (Cayman Chemical). Results are shown in Table II.

c. Fast assay for COX-1 and COX-2 activity

COX activity was assayed as PGE₂ formed/ μ g protein/time using an ELISA to detect the prostaglandin released. CHAPS-solubilized insect cell membranes containing the appropriate COX enzyme were incubated in a potassium phosphate buffer (0.05 M Potassium phosphate, pH 7.5, 2 μ M phenol, 1 μ M heme, 300 μ M epinephrine) with the addition of 20 μ l of 100 μ M arachidonic acid (10 μ M). Compounds were pre-incubated with the enzyme for 10 minutes at 25 °C prior to the addition of arachidonic acid. Any reaction between the arachidonic acid and the enzyme was

stopped after two minutes at 37 °C/room temperature by transferring 40 μ l of reaction mix into 160 μ l ELISA buffer and 25 μ M indomethacin. The PGE₂ formed was measured by standard ELISA technology (Cayman Chemical). Results are shown in Table II.

* fast assay

Also embraced within this invention is a class of pharmaceutical compositions comprising the active compounds of Formula I in association with one or more non-toxic, pharmaceutically-acceptable carriers and/or diluents and/or adjuvants (collectively referred to herein as "carrier" materials) and, if desired, other active ingredients. The active compounds of the present invention may be administered by any suitable route, preferably in the form of a pharmaceutical composition adapted to such a route, and in a dose effective for the treatment intended. The active compounds and composition may, for example, be administered orally, intra-vascularly, intraperitoneally, subcutaneously, intra-muscularly or topically.

The phrase "co-therapy" (or "combination-therapy"), in defining use of a cyclooxygenase-2 inhibitor agent and another pharmaceutical agent, is intended to embrace administration of each agent in a sequential manner in a regimen that will provide beneficial effects of the drug combination, and is intended as well to embrace co-administration of these agents in a substantially

simultaneous manner, such as in a single capsule having a fixed ratio of these active agents or in multiple, separate capsules for each agent.

The phrase "therapeutically-effective" is intended to qualify the amount of each agent which will achieve the goal of improvement in disease severity and the frequency of incidence over treatment of each agent by itself, while avoiding adverse side effects typically associated with alternative therapies.

For oral administration, the pharmaceutical composition may be in the form of, for example, a tablet, capsule, suspension or liquid. The pharmaceutical composition is preferably made in the form of a dosage unit containing a particular amount of the active ingredient. Examples of such dosage units are tablets or capsules. The active ingredient may also be administered by injection as a composition wherein, for example, saline, dextrose or water may be used as a suitable carrier.

The amount of therapeutically active compounds which are administered and the dosage regimen for treating a disease condition with the compounds and/or compositions of this invention depends on a variety of factors, including the age, weight, sex and medical condition of the subject, the severity of the disease, the route and frequency of administration, and the particular compound employed, and thus may vary widely. The pharmaceutical compositions may contain active ingredients in the range of about 0.1 to 2000 mg, preferably in the range of about 0.5 to 500 mg and most preferably between about 1 and 100 mg. A daily dose of about 0.01 to 100 mg/kg body weight, preferably between about 0.5 and about 20 mg/kg body weight and most preferably between about 0.1 to 10 mg/kg body weight, may be appropriate. The daily dose can be administered in one to four doses per day.

In the case of psoriasis and other skin conditions, it may be preferable to apply a topical preparation of

compounds of this invention to the affected area two to four times a day.

For inflammations of the eye or other external tissues, e.g., mouth and skin, the formulations are preferably applied as a topical ointment or cream, or as a suppository, containing the active ingredients in a total amount of, for example, 0.075 to 30% w/w, preferably 0.2 to 20% w/w and most preferably 0.4 to 15% w/w. When formulated in an ointment, the active ingredients may be employed with either paraffinic or a water-miscible ointment base. Alternatively, the active ingredients may be formulated in a cream with an oil-in-water cream base. If desired, the aqueous phase of the cream base may include, for example at least 30% w/w of a polyhydric alcohol such as propylene glycol, butane-1,3-diol, mannitol, sorbitol, glycerol, polyethylene glycol and mixtures thereof. The topical formulation may desirably include a compound which enhances absorption or penetration of the active ingredient through the skin or other affected areas. Examples of such dermal penetration enhancers include dimethylsulfoxide and related analogs. The compounds of this invention can also be administered by a transdermal device. Preferably topical administration will be accomplished using a patch either of the reservoir and porous membrane type or of a solid matrix variety. In either case, the active agent is delivered continuously from the reservoir or microcapsules through a membrane into the active agent permeable adhesive, which is in contact with the skin or mucosa of the recipient. If the active agent is absorbed through the skin, a controlled and predetermined flow of the active agent is administered to the recipient. In the case of microcapsules, the encapsulating agent may also function as the membrane.

The oily phase of the emulsions of this invention may be constituted from known ingredients in a known manner. While the phase may comprise merely an emulsifier, it may comprise a mixture of at least one

emulsifier with a fat or an oil or with both a fat and an oil. Preferably, a hydrophilic emulsifier is included together with a lipophilic emulsifier which acts as a stabilizer. It is also preferred to include both an oil and a fat. Together, the emulsifier(s) with or without stabilizer(s) make-up the so-called emulsifying wax, and the wax together with the oil and fat make up the so-called emulsifying ointment base which forms the oily dispersed phase of the cream formulations. Emulsifiers and emulsion stabilizers suitable for use in the formulation of the present invention include Tween 60, Span 80, cetostearyl alcohol, myristyl alcohol, glyceryl monostearate, and sodium lauryl sulfate, among others.

The choice of suitable oils or fats for the formulation is based on achieving the desired cosmetic properties, since the solubility of the active compound in most oils likely to be used in pharmaceutical emulsion formulations is very low. Thus, the cream should preferably be a non-greasy, non-staining and washable product with suitable consistency to avoid leakage from tubes or other containers. Straight or branched chain, mono- or dibasic alkyl esters such as di-isoadipate, isocetyl stearate, propylene glycol diester of coconut fatty acids, isopropyl myristate, decyl oleate, isopropyl palmitate, butyl stearate, 2-ethylhexyl palmitate or a blend of branched chain esters may be used. These may be used alone or in combination depending on the properties required. Alternatively, high melting point lipids such as white soft paraffin and/or liquid paraffin or other mineral oils can be used.

Formulations suitable for topical administration to the eye also include eye drops wherein the active ingredients are dissolved or suspended in suitable carrier, especially an aqueous solvent for the active ingredients. The antiinflammatory active ingredients are preferably present in such formulations in a concentration of 0.5 to 20%, advantageously 0.5 to 10% and particularly about 1.5% w/w.

For therapeutic purposes, the active compounds of this combination invention are ordinarily combined with one or more adjuvants appropriate to the indicated route of administration. If administered *per os*, the

5 compounds may be admixed with lactose, sucrose, starch powder, cellulose esters of alkanolic acids, cellulose alkyl esters, talc, stearic acid, magnesium stearate, magnesium oxide, sodium and calcium salts of phosphoric and sulfuric acids, gelatin, acacia gum, sodium alginate,

10 polyvinylpyrrolidone, and/or polyvinyl alcohol, and then tableted or encapsulated for convenient administration. Such capsules or tablets may contain a controlled-release formulation as may be provided in a dispersion of active compound in hydroxypropylmethyl cellulose. Formulations

15 for parenteral administration may be in the form of aqueous or non-aqueous isotonic sterile injection solutions or suspensions. These solutions and suspensions may be prepared from sterile powders or granules having one or more of the carriers or diluents

20 mentioned for use in the formulations for oral administration. The compounds may be dissolved in water, polyethylene glycol, propylene glycol, ethanol, corn oil, cottonseed oil, peanut oil, sesame oil, benzyl alcohol, sodium chloride, and/or various buffers. Other adjuvants

25 and modes of administration are well and widely known in the pharmaceutical art.

All mentioned references are incorporated by reference as if here written. The priority document, USSN 60/044,485 is also incorporated by reference.
